Category-level values represent the **unweighted arithmetic average** of commodity-level changes within each respective category.
For each division, the representative price of every commodity is calculated as the geometric mean of its district-level prices. Base prices and commodity weights are then applied to obtain weighted price relatives for the current and previous weeks.
Commodity-level week-on-week percentage changes are calculated from the current- and previous-week weighted price relatives.
The Sindh column is calculated independently using the geometric mean of prices across all 30 districts for each commodity, followed by the same weighting, week-on-week change and category-aggregation procedure. It is not calculated from the six divisional values.

[1] Category changes in Table 1 are derived from the SPI-Sindh category indices using the prescribed item weights. The division-level figures in Table 3 represent averages of commodity-level percentage changes and are therefore not directly comparable with the category-index changes reported in Table 1.
